Code

Task 1

```
//Task 1A
//Potentiometer on A0 → % on Serial Monitor

const int POT_PIN = A0;

void setup() {
    Serial.begin(9600);
}

void loop() {
    int raw = analogRead(POT_PIN); //0..1023
    float pct = (raw / 1023.0) * 100.0; //map to 0..100%
    Serial.print("raw=");
    Serial.print(raw);
    Serial.print("\tpercent=");
    Serial.println(pct);
    delay(50);
}
```

```
//Task 1B
//Potentiometer on A0 → % on Serial Plotter

const int POT_PIN = A0;

void setup() {
    Serial.begin(9600);
}

void loop() {
    int raw = analogRead(POT_PIN);
    Serial.println(sensorValue);
    delay(50);
}
```

Task 2

```
//Task 2
//LDR Voltage Divider with Thresholds

const int LDR_PIN = A0;

void setup() {
    Serial.begin(9600);
}

void loop() {
    int raw = analogRead(LDR_PIN); //0..1023
    Serial.print("Light Level=");
    Serial.print(raw);

    if (raw > 700) Serial.println("Bright");
    else if (raw > 300) Serial.println("Normal");
    else Serial.println("Dark");

    delay(100); //Updates
}
```

Task 3

```
//Task 3
//Servo from Potentiometer with Rate-Limit/Deadband

#include <Servo.h>

const int POT_PIN = A0;
const int SERVO_PIN = 9;
Servo myServo;

int lastAngle = 0;
unsigned long lastMove = 0;
const int DEAD_BAND = 10; //Ignore changes < 10
const unsigned long MOVE_DELAY = 20; //Rate limit (ms)

void setup() {
    Serial.begin(9600);
    myServo.attach(SERVO_PIN);
}

void loop() {
    int raw = analogRead(POT_PIN); //0..1023
    int targetAngle = map(raw, 0, 1023, 0, 180); //Map to 0-180°

    // Deadband: Only move if change is significant
    if (abs(targetAngle - lastAngle) > DEAD_BAND) {
        if (millis() - lastMove >= MOVE_DELAY) {
            lastMove = millis();
            myServo.write(targetAngle);
            lastAngle = targetAngle;
            Serial.print("Angle=");
            Serial.println(targetAngle);
        }
    }

    delay(10); //Small delay
}
```

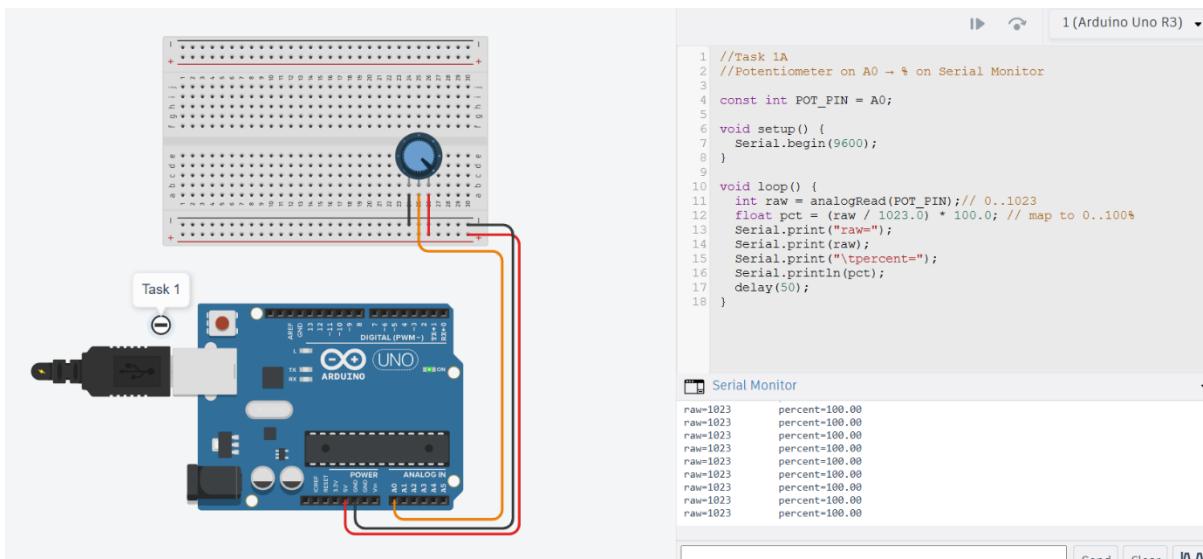

Output

180-degree angle for Servo

Reflections

Task 1

Mapping is a process whereby scaling the number a range which can range from the minimum to the maximum value. So, the task scaled the raw sensor reading of the potentiometer which is using an analogue value which was 0 to 1023 then it put into percentage from 0 to 100%.

Task 2

One limitation of Light Dependent Resistor (LDR) is a slow response time which is a disadvantage if an application needed a fast detection in the changes of light which can lead to inaccurate readings. A digital light sensor would be a better choice as it is faster and more accurate instrument.

Task 3

There exists a correlation between smoothness and responsiveness whereby a larger delay will reduce the jitter, but this slows the servo's reaction to its own movement. An application may need a higher responsiveness, but they must be prepared to sacrifice the smoothness of the servo.
